

## Feedbacks from testing

### 1) Mid-Fidelity Prototype

- Sign in takes a long time
- Side menus are usually on the left side
- There is too many text
- On the page "We are almost done" change "Now you already can enter with your account" to "Now you can already enter with your account"
- On the page "Schedule new payment" change "How much was it?" to "How much is it?"
- On the page "Add friend" besides the phone number also need to add the name of the person
- Put notifications outside the side menu
- It doesn't need to have 2 validation codes to register, it only needs one (phone or email)
- It's not very clear what the categories in the main menu are
- Some screens are too big and have to scroll down to see the interaction button
- Separate the page where you input your name and the email
- Put the categories in the home page as buttons
- Increase the font size of the inputs
- Put customer service in the end
- For the first time installed the app, it should give the choice of sign in, because we may already have the account.
- The log out is important too.
- At the main page, it is not so clear if the amount of different banks is the money in the account or the money already spent of one account in this month. And if we have more than two accounts, it shows be all represented there.
- It is possible that the expense split equally. Maybe could add an option to let the user put the amount by themselves.
- For the final page of adding a friend, it's better to present the name too. And it would be better if changing the name for the friend (maybe a nickname) is possible.
- It's better for every operation, the previous button is available.
